WORKING PLAN FOR
GEOLOGICAL INVESTIGATION

Project	:	Hanoi City Ring Road No. 3 Construction Project, Mai Dich - South Thang Long Section
Location	:	North Tu Liem district and Cau Giay district, Hanoi City
Stage	:	Detailed Design

1. BASE OF ESTABLISHED WORKING PLAND

1.1. Introduction

The Hanoi City Ring road No3 construction Project is a part of Ring road No3 route with a viaduct above the middle medial of Pham Van Dong road. Now, City Ring road No3 construction Project, Thanh Tri- Mai Dich section is built and opened to traffic. The Mai Dich- South Thang Long has not yet finished. During peak hours, the traffic flow exceeds through Pham Van Dong road causing traffic congestion. Therefore, it is necessary to research on plan for building a Viaduct on The Ring road No3 to meet traffic demand.

The profile report stepped up Investment projects of Viaduct construction Mai Dich- South Thang Long section, The Hanoi City Ring road No3 has been established by Transport Engineering Design Incorporated (TEDI) in 2012

The working plan established for the geological investigation for the Hanoi city Ring road No3, Mai Dich- South Thang Long section in the detailed design stage.

1.2. Legal Bases

- Law on Construction promulgated by the National Assembly of the Socialist Republic of Vietnam on 26th, November 2003 and Law No. 38/2009/QH12 dated 19th, June 2009 amending and supplementing a number of articles of the laws concerning capital construction investment;
- The Government's Decree No. 12/2009/ND-CP dated 12nd February, 2009 of the Government on management of investment projects on the construction of works and

the Government's Decree No. 83/2009/ND-CP dated 15th October, 2009 amending and supplementing a number of articles of Decree No. 12/2009/ND-CP;

- Decree No.15/2013/NĐ-CP, dated February 6th 2013, issued by Government for quality management of construction work;
- The Decree No.209/2004/NĐ-CP dated 16th December, 2004 by the Government on the Management of Building Works Quality and the Decree No.49/2008/NĐ-CP dated 18th April, 2008 on additional adjustment of some articles in the Decree No.209/2004/NĐ-CP;
- The Decree No. 112/2009/NĐ-CP dated 14th December, 2009 by the Government on the Management of Construction Investment Expenditure;
- The Circular No. 12/2005/TT-BXD dated 15th July, 2005 by the Ministry of Construction on guiding a number of provisions on quality management of construction works and capacity condition of organization and individuals in construction activity;
- The Circular No. 06/2006/TT-BXD dated 10th November, 2006 on guiding geotechnical surveys in service of selection of construction locations and designing of works;
- Contract for consulting services of technical design, cost estimation and tender assistance for Hanoi Ring Road No.3 construction project, Mai Dich – South Thang Long section, Contact No 1725/HD-PMUTL, dated June 19th 2015;
- The Report on Geological investigation for Hanoi City Ring Road No.3 Construction Project, Mai Dich - South Thang Long Section in the Basic Design Stage have been established by Transport Engineering Design Incorporated (TEDI) in 2012

1.3. Study Scope

The study scope of Hanoi City Ring Road No.3 Construction Project, Mai Dich - South Thang Long Section in the detailed design stage includes:

- Beginning point: Km 0+130, the North of The Mai Dich bridge;
- Ending point: Km 5+493.7, the South of the Thang Long bridge
- Length: 5.364 km along the Project road

1.4. Investigation Objectives

1.4.1. Investigation Items

- Geological investigation for bridge:

- Geological investigation for pile;
- Geological investigation for abutments;

- Geological investigation for road:
  - Geological investigation for approach roadbase
  - Geological investigation for extent roadbase
- Geological investigation for retaining wall.
  - Geological investigation for retaining wall at the beginning of route
  - Geological investigation for retaining wall at the end of route

1.4.2. Investigation Objectives

To assess the current status of road pavement and identify modulus of elasticity of Pham Van Dong road pavement to design stage in the project scope.

The geological investigation to provide the necessary documents on geotechnical conditions for the designing and construction of Hanoi City Ring Road No. 3 Construction Project, Mai Dich - South Thang Long Section:

- Indentify strata, boundary and mechanical-physical properties of soil layers in the construction area;
- Determining underground water level, corrosion of water to concrete and reinforce concrete structures.

2. QUANTITY OF WORKS

According to the Contact No 1725/HD-PMUTL, dated June 19th 2015, quantities of the geological investigation for the project are shown on following table:

No.	Item	Unit	Quantity
1	**Geological investigation for bridge**		
1.1	Number of boreholes	Hole	115
1.2	Drilling depth	m	45.0
1.3	Drilling meters total	m	5.175
1.4	Sampling	Sample	2.588
1.5	Laboratory testing		1.812
	- Undisturbed samples	Sample	1.268
	- Disturbed samples	Sample	543
	- Unconfined compression test	Sample	190
	-Testing on water sample	Sample	04
1.6	SPT testing	Point	2.588
1.7	Determining underground water level	Hole	115
2	**Geological investigation for retaining wall**		

No.	Item	Unit	Quantity
2.1	Number of boreholes	Hole	02
2.2	Drilling depth	m	30
2.3	Drilling meters total	m	60
2.4	Sampling	Sample	30
2.5	Laboratory testing		21
	- Undisturbed samples	Sample	15
	- Disturbed samples	Sample	06
	- Unconfined compression test	Sample	08
	- Triaxial compression test (CU)	Sample	02
	- Triaxial compression test (UU)	Sample	02
	- Consolidation test	Sample	02
2.6	Determining underground water level	Hole	02
2.7	SPT testing	Point	30
3	**Investigation for material construction mine**		
3.1	Filling soil mine	Mine/sample	1/3
3.2	Filling sand mine	Mine/sample	1/3
3.3	Construction sand mine	Mine/sample	2/5
3.4	Construction rock mine	Mine/sample	1/8
3.5	Investigation for waste yard	Location	02
4	**Investigation for current road pavement**		
4.1	Investigation for current status of road pavement	Km	5.5
4.2	Measurements Pavement strength by Benkelman	Point	20

3. EXCUTIVE METHOD AND EQUIPMENT

3.1. Preparation works

To obtain and prepare for relating document, including:

- Hanoi geological map with scale of 1/200.000;
- Document of geological investigation obtained while Hanoi City Ring Road No. 3 Construction Project, Mai Ditch - South Thing Long Section in the Investment projects stage.

3.2. Locating borehole location

3.2.1. Objectives

Locating boreholes from the drawing to the field according to the co-ordinate of borehole conforming to the approved topography surveying co-ordinate VN2000.

3.2.2. Equipment

Using Total Stations NIVO3M and GTS -235N (Produc of ToPcom Japan) or Equivalence.

3.2.3. Executive method

- Using intersection method, levelling by Total Stations base on GPS benchmarks, secondary control point of the project;
- After determining, borehole locations are marked by wood stakes;
- All boreholes have acceptance record of location between The Investigation Contractor, Consulant and Employer.

3.2.4. Technical requirement

- Borehole locations are determined on relief map by national coordinate system;
- In case borehole location is stuck by private house or other project that must to shift, Investigation Contractor must send report document include shifting outline location to the design manager. Drilling mission is carried out only after approved by the Consultants and PMU Thang Long.

3.3. Drilling

3.3.1. Objectives

- Determining stratum and geological feature in the surveying area;
- Implementing tests at the field (according to Standard Penetration Test - SPT...);
- Getting the samples of soil and water for testing;
- Install standpipe, determination and monitor of groundwater level in drilling hole.

3.3.2. Objectives

- Using China XY-1 or XY-1A with following technical features:
- Maximum depth: 150m;
- Maximum diameter: 152mm;
- Rod diameter: 42mm;
- Weight (no diesel engine): 550kg.

3.3.3. Executive method

- Equipment should be upright installed and avoid any shifting in whole drilling process;
- Used method is rotary drilling by using the sample barrel enclosed alloy drill twist, pumping and cleaning with Bentonit solution. The open hole diameter is 127mm, terminate diameter is 76-91mm;
- Drilling mission will accompany with installing temporary casing when the bore hole doesn't stabilize because of soft soil stratum, quick sand phenomenon;
- The boring process is done to the required depth of sampling, then it will be stopped to perform the sampling and SPT standard follow technical requirements of the TOR for Survey and Design;

- Before carrying out SPT test or taking sample, bore hole bottom should be cleaned then determined the depth again;
- The follow-up process at the field must be recorded in the works journal including elaboration of boring log. Borehole must be named in a boring log, it should mention in the depth, completed part and thickness of the soil layer, depth of sampling, the state, the colours of the soil, SPT testing indicator; elevation, coordinates of the borehole, the supervisor's name, beginning and ending date of the borehole. Each borehole must be recorded in the acceptance certificate as regulated;
- Colour photograph should be taken for boring at site, including borehole location, SPT testing, FVST testing, collected samples, total of drilling rod.
- After check and take over, boreholes should be filled in according to the standards of geology exploratory drilling process TCVN 9437-2012. All boreholes must have acceptance minutes for filling of boreholes.

3.3.4. Technical requirement and Termination of boring

- The boring carry out according to the standards of geology exploratory drilling process TCVN 9437-2012;
- For road: Boring shall be drilled to the estimated depth when drilling without soft soil. In case of soft soil, boring shall be terminated when drilling penetrated into bearing stratum 4m thickness of from and over stiff clayey soil or medium dense sandy soil;
- For bridge: Boring shall be terminated when drilling penetrated into bearing stratum such as 10-12m thickness of clayey soil (N>30) or sandy soil (N>50); 6-8m thickness of gravel soil (N>50).
- For retaining wall: Boring shall be terminated when drilling penetrated into bearing stratum 6-8m thickness of clayey soil (N>15) or sandy soil (N>30);
- *Notes: For all boreholes, when boring penetrated in to the estimated depth but not meet technical requirements, it shall be continued drilling into load-resistant layer as assigned after having approval from the Consultants and PMU Thang Long.*

3.4. Sampling

3.4.1. Objectives

- Taking samples for determining physical/ mechanical properties of soil layers;
- Taking water sample in borehole for analysis and calculation for determining water's erosion indicators for concrete reinforce concrete structures;
- Taking sample for later referencs.

3.4.2. Equipment

- Thin wall tube sampler 91mm;
- Open-tube type 91mm;
- Opened sampler (SPT sampler);
- Water sapling tool.

3.4.3. Executive method

- Using thin wall tube sampler, outer diameter of 76mm taking undisturbed sample in the soft soil . Sampler is pushed into the soil by static load. Length of tube sampler is 80cm;
- Using Open-tube type, outer diameter of 91mm taking undisturbed sample in the from and over medium stiff soil. It is often driven into ground with a slide hammer or a bob. Length of sampler 20cm;
- Disturbed samples is collectsd from split barrel when SPT test or using Open-tube type to take;
- Before taking sample must clean the borehole bottom and guarantee unaffected to the intended taking sample layer, avoid losing undisturbed property of sample;
- All undisturbed sample should be sealed to keep humidity. End of sample tube should be jacketed and adhesive tape hold;
- The labels with signal, name of the project, name of borehole, date of sampling, person in charge, the depth, status, color of the soil must be sticked on the boxes.
- Sample for later referencs is selected during drilling process, the over of undisturbed sample, disturbed sample or SPT core. The sample for later referencs after taken shall be keep in a plastic box with eteketto (same as UD, D sample).
- Under ground water taking in borehole. After having bored, using the pump to clean boring so that waiting underground coming into the borehole. Taking water will be implemented when the water becomes clear, but not over 12 hours after cleaning the borehole. Water sample will be taken in 2 glass bottles with volume of 1 litter. In which, 1 bottle should contain 6g badigeon to determine CO2 erosion content. After having sampled, the cord must be closed carefully, sealed paraphin, and sticked label with following information: Name of water sample, borehole and the depth for sampling, taking date, person in charge, volume of additional chemical.

3.4.4. Technical requirement

- Undisturbed and disturbed carry out according to the standards of geology exploratory drilling TCVN 9437-2012;

- Undisturbed and disturbed will be conducted with 2.0m/ 1sample;
- Sample for later referencs will be conducted with 1.0m/ 1sample
- All samples have to be taken photograph for serving preservation and inspection.

3.5. Standard penetration test (SPT)

3.5.1. Objectives

- Determining the soil state, soil resistance in SPT;
- Sampling disturbed sample for the sandy soil.

3.5.2. Equipment

- Using Vietnamese/China equipment with following technical features:
- SPT hammer weight: 63.5kg;
- Free fall height: 760mm;
- Penetration tip (bifurcated sampler) outside diameter 50.8mm;
- Cone solid penetration tip 600 diameter 50.8mm.

3.5.3. Executive method

- Drill to the SPT estimate depth;
- Pumping clean the borehole bottom then determine the depth again;
- Take the rod fitting SPT tip down the bore hole;
- SPT sampler is driven 45cm from the bottom of borehole by the hammer 63.5kg, falling height 760mm. SPT value is total of blows of the second 15cm and the thirst 15cm. The SPT graph will be present on the boring logs;
- When penetrate in gravel or strong cracked and weathered stone, bifurcated sampler can be replaced by cone solid penetration tip 600.

3.5.4. Technical requirement

- Standard penetration test (SPT) is executed in boreholes for bridge and retaining wall according to TCXD 226-1999 standard;
- Standard Penetration tests (SPT) will be conducted at bridge boreholes and retaining wall boreholes with 2.0m intervals.
- All SPT sample after taken should be put into plastic box, careful protected avoid nature moisture variation and transfer to the laboratory.

3.6. Determination of underground water level

Determination of underground water level will be carried out in all on shore boreholes. The underground water level shall be defined as follows:

- After having bored, using the pump to clean boring;

- The underground water level will be checked 48h after the drilling process (waiting underground level in borehole is stable);
- The results observable undeground water are presented in the report on geological investigation

3.7. Transporting preservation samples

- All samples must be keep in cool area and good condition, protected from crashing and other outside factors;
- In order to avoid damage, all samples must be keep carefully in containing box;
- After finishing drilling for each borehole, samples will be transported to the laboratory that Investigation Contractor assigns and Employer approves. During transporting process, the samples must be protected from crashing;
- Method of take, package, transportation and maintenance for sample should be obeyed strictly TCVN 2683-1991 standards.

3.8. Filling borehole

After check and take over, boreholes should be filled back in according to the standards of geology exploratory drilling process TCVN 9437-2012.

3.9. Investigation for material mine

3.9.1. Objectives

- Determining location, mine management levels, material supply, the estimated quantity, the quality of material, the distance from source to construction, price.
- Taking sample material at source to test in the laboratory.

3.9.2. Equipment

- Topography of status mines.
- Transportation map, distance measuring equipment from source to construction.

3.9.3. Executive method

- Determining sand, soil, rock mine can exploit or are exploited;
- Discussion with local administrations / Management mine agency for contract agreement and located up on diagrams;
- Collecting the document about quantity, quality, exploiting and providing ability, condition transportation to construction, material costs ...;
- Additional investigation for sand yard: sand source managing unit, ability to provide from the mine, the unit price in the mine;
- Taking sample for the laboratory test to assess the quality of the material.

3.9.4. Technical requirement

- Before investigation, it is necessary to have agreement with Head of the Geotechnical Investigation on the location of material mine. Principles of surveying borrow pits have evenly distributed in the route, rock and sand construction near the project area;
- Showing the location and information of each mine on the construction material mine diagram. Besides, showing and describing the existing roads used to transport materials to the project.

3.10. Investigation for waste yard

- Conduction a survey of possible locations poured waste materials during construction, locating on the diagram; distance to projects; area and volume of waste material obtain written agreement with the local.

3.11 Investigation for current road base

3.11.1 Assess the situation of the current road surface

- Inspection along existing roads;
- Study on topography, longitudinal section, cross section of current road
- Observation, classifying failure situation of current road coat;
- Topographic conditions and geometric factors of route;
- Type road base, type of ground base;
- Type hydrologic of base;
- Status and failure scope of road.

3.11.2 Measurement of overall elastic modulus of pavement by Benkelman

3.11.2.1 Equipment

Loaded vehicles with rear axle load of 10T

- Benkelman beam with technical parameters mainly follows

+ Scale of beam: 1:2;
+ Vibration system eliminated residual deformation of beam;
+ Dial Gauges with readable value to 0.01mm
+ 32T hydraulic jack to identify the rear axle of the vehicle weight;
+ Digital thermometer with a range of approximately 0°C to 100°C;

3.11.2.2 Executive method

a) Arranging measurement points

- Alternate Arranging;
- Distance measuring 50m / point.

b) Executive method

Check the specifications of vehicles:

+ Check axle load by hydraulic jack, check area of outer wheel path by oiling up the wheel and place on cell paper and measuring exposure area;

+ Set up the Benkelman Beams and check sensitivity of deformation equipment;

+ Locate the truck at the test site, adjust beam in the equilibrium position, and set the vibrating parts stable, read and record the reading;

+ Move truck very slowly forward until the rear axle is just over the 5.00 metre marking; wait for deformation recovered completely and vibration operations. Read and record the dial gauge reading as before.

+ Continue on to next test point and allow the same process as above.

c) **Data processing**

- Eliminating the error terms during measurement;
- Graphed the relationship between elastic deflection and the point of measurement;
- Establishing and divided into by the equivalent strength segment;
- Determination of featured elastic deflection to calculate the elastic modulus of the route;
- Charting featured elastic deflection calculations along route.

d) Technical requirement

Testing conducted obey standard: TCXDVN 8867: 2011 – Flexible pavement-standard test method for determination of elastic modulus of pavement structure using Benkelman beam.

3.12. Laboratory testing

- All samples are tested in accordance with Vietnamese standards; those not falling into any Vietnamese standard will be tested under international ones;
- Soil classification according to the standards TCVN 5747:1993;
- Testing properties shall be selected to ensure design requirements. Test criteria shall be proposed by the Geological manager and approved by Design manager.

  For the undisturbed sample:
- Properties shall be tested as follows: grain size (P %), moisture content (W %), specific gravity (Δ), unit weight (γ), liquid limit (WL), plastic limit (Wp), and compression test (compressibility coefficient a), direct shear test (cohesive power - C; internal friction angle -φ), organic content (if any); consolidation test (Cv), triaxial compression test (UU, CU) for the soft soil.

- For bridge boreholes and retaining wall boreholes, unconfined compression test for cohesive soil layer with stiff state and over (SPT≥8) shall be carried out.

For the disturbed sample:

- For the cohesive soil shall be tested as follows: grain size (P %), moisture content (W %), specific gravity (Δ), liquid limit (WL), plastic limit (WP).
- For the in cohesive soil shall be tested as follows: grain size (P %), specific gravity (Δ), dry and wet angle of repose, maximum void ratio (e_{max}), minimum void ratio (e_{min}).

For the water samples:

- For water sample following testing: pH, total mineralized level M, temperature, free content of C02, CO2 corrosion, HCO3-, SO42-, Cl-, Ca2+ , Mg2+, (Na+K)+, Mg2+, water naming conformable to the formula Cuoc-lop.

For filling soil samples

- Determining the parameters: P(%),Δ, W, WL, WP, compaction standard (γ_{cmax}, Wo), CBR.

For filling sand samples

- Determining the parameters: P(%),Δ, W, compaction standard (γ_{cmax}, Wo), Angle of repose Dry(αd), Angle of repose Saturated (αw), Void ratio of sand max (e_{max}), Void ratio of sand min (e_{min}), CBR.

For construction sand samples

- Determining the parameters: P(%),Δ, Clay dust content, organic content, Size Modulus (Mk).
- *For rock material source*
- Determining the parameters: name of rock,Δ, strength and softening coefficient of the original stone, Los Angles abrasion.

3.13. Reporting

The content and form of Geotechnical investigation reports, Surveying construction and stockpiled material report, Investigation for pavement and ground road have to comply with decree 15/2013 / ND-CP.

3.14. Submitted report

Number of documents will be submitted: 10 Vietnamese versions + 10 English versions + 01 CD (file).

3.15. Language

All letters and reports submitted to the Consultants must be in English versions. The Final report will be submitted in both Vietnamese and English.

3.16. Others regulations

Color photograph should be taken for each investigation article to store and insert to geological engineering investigation document, detailed as follow:

- Each borehole take 01 panorama picture with a board include project name, borehole name, start date, 01 picture snap SPT test, 01 picture snap FVST test, and 01 picture snap when finish the bore hole;
- Laboratory testing: snap when open sample and keeping sample after test.

4. APPLIED STANDARDS

The geological investigation will be carried out/ referent in accordance with the standards is shown on following table:

No	Description of Specification	Code of standard
1	Construction survey - Basic principles	TCVN 4419:1987
2	Standards of engineering geological exploratory drilling	TCVN 9437-2012
4	Procedure of Roadway Investigation	22TCN 263-2000
5	Geotechnical investigation for design and construction of pile foundation	TCXDVN 160:1987
6	Guiding collection, transportation, and preservation of soil sample	TCVN 5960:1995
7	Method of wrapping, transporting and saving sample	TCVN 2683:2012
8	Construction soil - Method of field testing - Standard Penetration Test (SPT)	TCVN 9351:2012
9	Construction soil-Method to determine Gravity in Laboratory	TCVN 4195: 2012
10	Construction soil-Method to determine Moisture content and desiccate in Laboratory	TCVN 4196: 2012
11	Construction soil-Method to determine Plastic limit and Liquid limit in Laboratory	TCVN 4197: 2012
12	Construction soil-Method to determine Particle (grain) size in Laboratory	TCVN 4198: 2012
13	Construction soil for hydrology geological project -Method to determine Repose angles (Dry & Saturated) and Voids Radio (Max and Min) for Sand in Laboratory	TCVN 8724:2012 TCVN8721:2012
14	Construction soil-Method to determine Direct shear strength in Laboratory	TCVN 4199:1995
15	+ Construction soil-Method to determine Compression in Laboratory	TCVN 4200: 2012
16	+ Consolidation test	
17	Construction soil for -Method to determine Bulk density in	TCVN 4202: 2012

No	Description of Specification	Code of standard
	Laboratory	
18	Standard Test Method for Unconfined Compressive Strength of Cohesive Soil (qu)	TCVN 9438:2012
19	Standard Test Method for Unconsolidated-Undrained Triaxial Compression Test for Cohesive Soils (UU)	TCVN 8868 - 2011
20	Standard Test Method for Consolidated Undrained Triaxial Compression Test for Cohesive Soils (CU)	TCVN 8868 - 2011
21	Construction soil - Classification	TCVN 5747-1993
22	Testing of defining physical, chemical criteria of overall water sample	TCVN 3994:1985
23	Determination of elastic modulus of pavement structure using Benkelman beam.	TCVN 8867:2011
24	Test methods of aggregates for concrete and mortar	TCVN 7572-1:2006 TCVN 7275-20:2006
25	Compaction standard test	22TCN 333:06
26	CBR test	22TCN 332:06
27	Specifications of Aggregates for concrete and mortar	TCVN 7570:2006

5. ARRANGEMENT AND RATE OF PROGRESS

5.1. Arrangement

The geological investigation is expected to be mobilized 16 boring staff 2laboratories working separately, under the guidance of geological manager.

List of main person for geological investigation is shown on following table:

No.	Name	Title	Telephone
1	Tran Dung Thang	Project manager	-
2	Le Tien Dung	Geological manager	
3	Nguyen The Anh	Vice Geological manager	
4	Hoang Trung Hieu	Leader of laboratory LASXD910	
5	Pham Thi Thu Ha	Vice leader of Laboratory LASXD910	
6	Pham Tuan Anh	Leader of laboratory LASXD-69	

Detailed list of person for the project is shown in Appendix 6.

5.2. Machine and equipment mobilization

Mobilized investigation equipment should guarantee ability executive project technical requirements. Machines, equipment are listed as following table:

No.	Equipment / Inv. Team	Drilling & Sampling (set)	SPT test (set)	Total Stasion (set)	Water sampling (set)
1	T&C	16	16	3	4
Total		**16**	**16**	**3**	**4**

5.3. Name of Laboratory

The laboratory testing should be carried out at 2 laboratories. The list of laboratory (including laboratory name, LAS number and address) are shown on following table:

No.	Laboratory	LAS No.	Address
1	Geotechnical and Material Laboratory Department	LAS-XD 910	16/28, lane 210, Hoan Quoc Viet, Cau Giay, Ha Noi
2	Geotechnical &Inspection Testing Center	LAS-XD 69	237 Luong The Vinh, Trung Van, Tu Liem, Ha Noi

6. RATE OF PROGRESS

6.1. Rate of Geotechnical Investigation progress

- Transportation the machines and equipment to site (03 days);
- Surveying site (45 days);
- Laboratory testing (65 days);
- Reporting(15 days);
- Back up progress (05 days);
- Total time: 90 days

6.2. Rate of material mine investigation progress

- Preparation (01 day);
- Surveying site (20 days);
- Laboratory testing (20 days);
- Reporting (05 days)
- Total time: 46 days

(The detailed plan of investigation works is shown in Appendix 1)

7. PROTECTION OF TECHNICAL INFASTURAL

Before implementation, the Investigation Contractor must be checked the around survey area to find out obstacles such as water drainage and supply pipeline, underground electric cables, telephone cable, fibber optics ... If there are any problems, it should report to Consultants and contact the management agencies to protect the above mentioned infrastructures so as to not happen damage and unsafely when boring or moving borehole location.

8. ENVIRONMENTAL SANITATION

- Environmental sanitation is carried out in all investigation time. The guaranteed environmental sanitation at the investigation areas will be restored as the beginning;
- Drill cuttings, wastes (oil, grease), soil core... shall be revoked, transported to shore and treated according to regulations, not let out directly to surround environment.

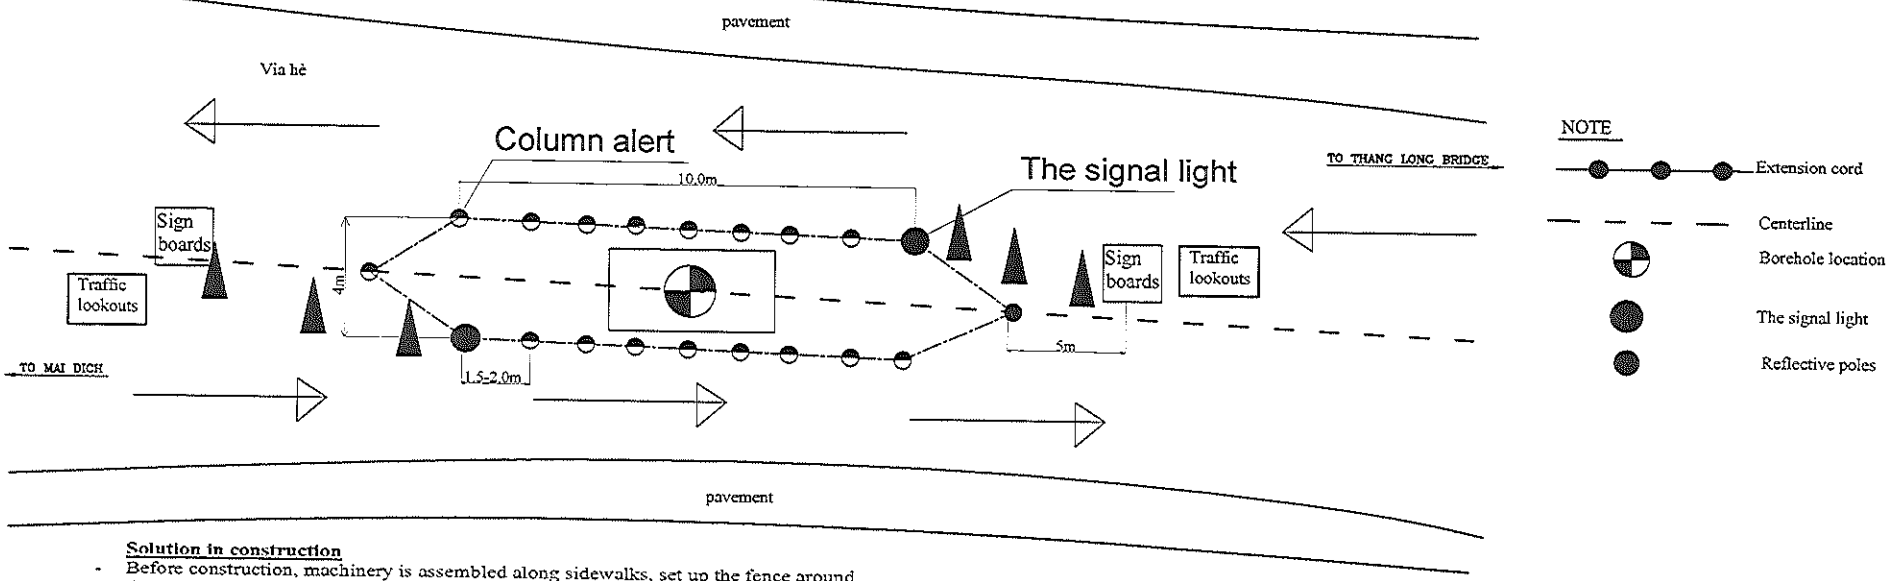
9. WORKING SEFETY GUARANTEE

The Contractor must be guaranteed working safety, traffic safety in all investigation time. Safety methods guarantee as follow:

- Equip for investigation staff enough equipment, working safety devices such as safety shoes, safety helmet, safety vest...;
- Supervise and speed up located drilling equipment and operating process. When carrying out the work should not cause traffic jammed;
- If survey is carried out at day, it needs to have speed limit board and survey is carried out at night, it needs to have flashing;
- With the borehole located in the traffic security corridor, railway, Investigation Contractor should apply to the appropriate authorities to get construction permission and traffic flow control regulated.

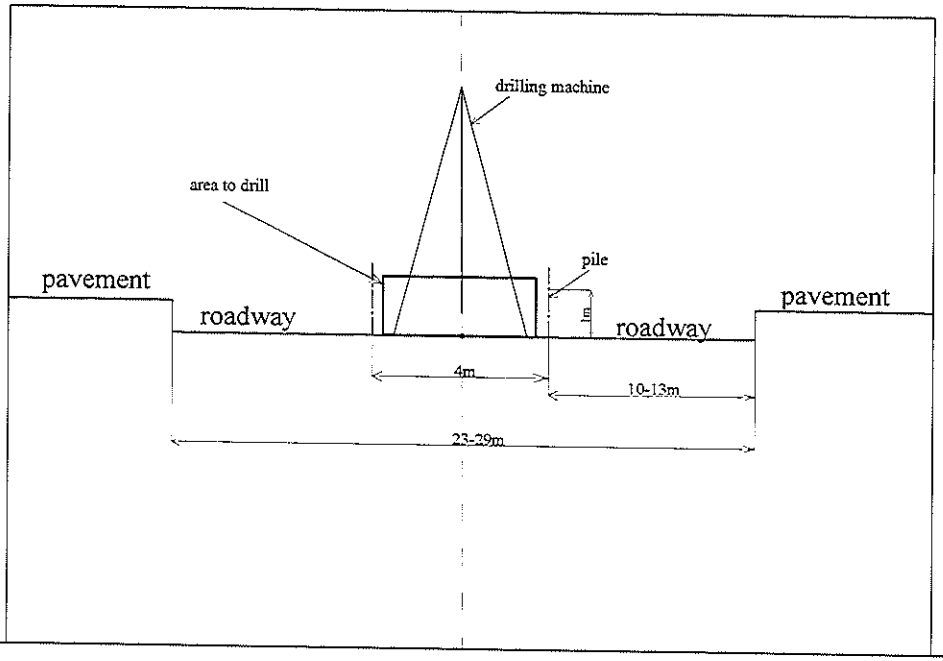
Details of construction solutions can be seen in the drawing (next page)

Drill holes located on the centerline

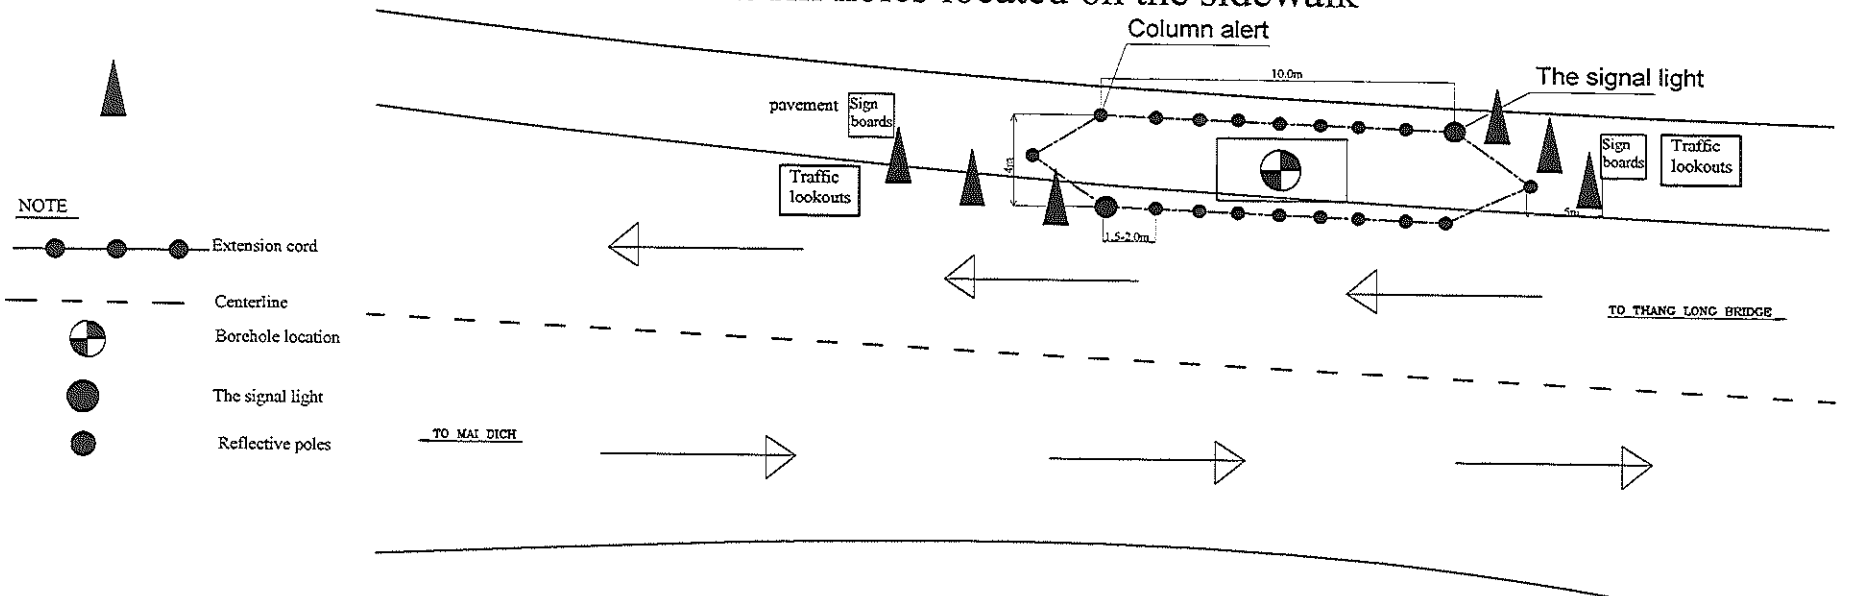


Solution in construction

- Before construction, machinery is assembled along sidewalks, set up the fence around the machine and signboards;
- After sorting machinery stably, we can carry out thepreparation of work site:
  + The sites of drill holesurfaceare arranged 4m x 10m
  + Set up piles in order to protected corridor on both sides of the machine, positioned parallel to the roadway. Piles are designed 1.5m in length, the distance between the poles is 1.5-2m, connected with wire stakes are reflective rope. Each corridor is estimated at 10m.
  + Traffic signal lightsshould be settled at the first pile and the last pile and necessary to appoint staff to guide and manage the traffic
  + Put up warning signboards (alert direction warning signboard, narrow roadssignboard, constructionsiteboards) at two sides of the construction area. Placement of billboards should be about 5m farfrom marker fence.
  + After finishing the preparation work, it is necessary to appoint staff to guide and manage the traffic to transport the driller to the drilling position.Arranging machine floor neatly, not exceed the scope of construction. When excuting, the occupied area by the driller should be about 3-4m; after finished drilling date, put machine's leg(reduced to about 1 meter), supplies and piles neatly in orderto return road for traffic participants.
- Because of location of construction includes roadway and sidewalk so construction time should be arranged throughout the day and night:
  + With line heart boreholes, because of high traffic density, conducted time should be at night from 8 pm(previous day) to 4 am (next day)
  + With side walk boreholes, there is a litle effect on the circulation of vehicles, so the conducted time should be during the day, starting from 7am to 6 pm.
- On implementing the construction works, all drilling teams must obey all the regulations on labor safety in the construction and regulations during the construction on roads where being exploited. People on the construction sitemust be fully equipped with protective clothing, shoes, hard hat as prescribed.
- After finished all the construction, original status of road should be returned.
- After construction, original status of road should be returned.
- Construction work is divided into 4 section:
  + Section 1: Km 0+00 – Km 0+910
  + Section 2: Km 0+910 – Km 1+940
  + Section 3: Km 1+940 – Km 3+200
  + Section 4: Km 3+200 – Km 5+500
- Construction time starting on 08.10.2015 until 30.10.2015

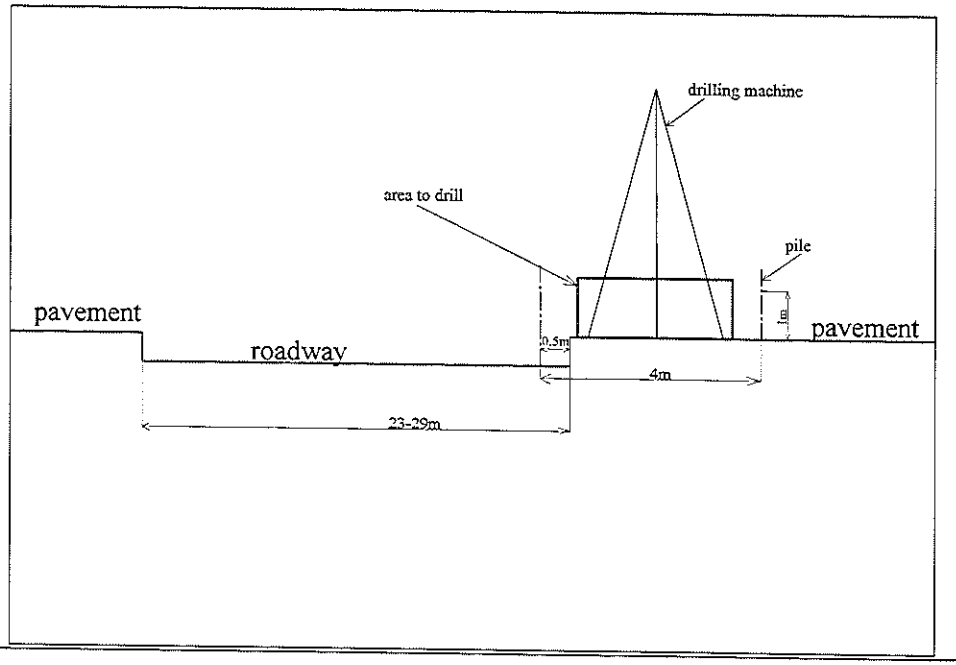


Drill holes located on the sidewalk



Solution in construction

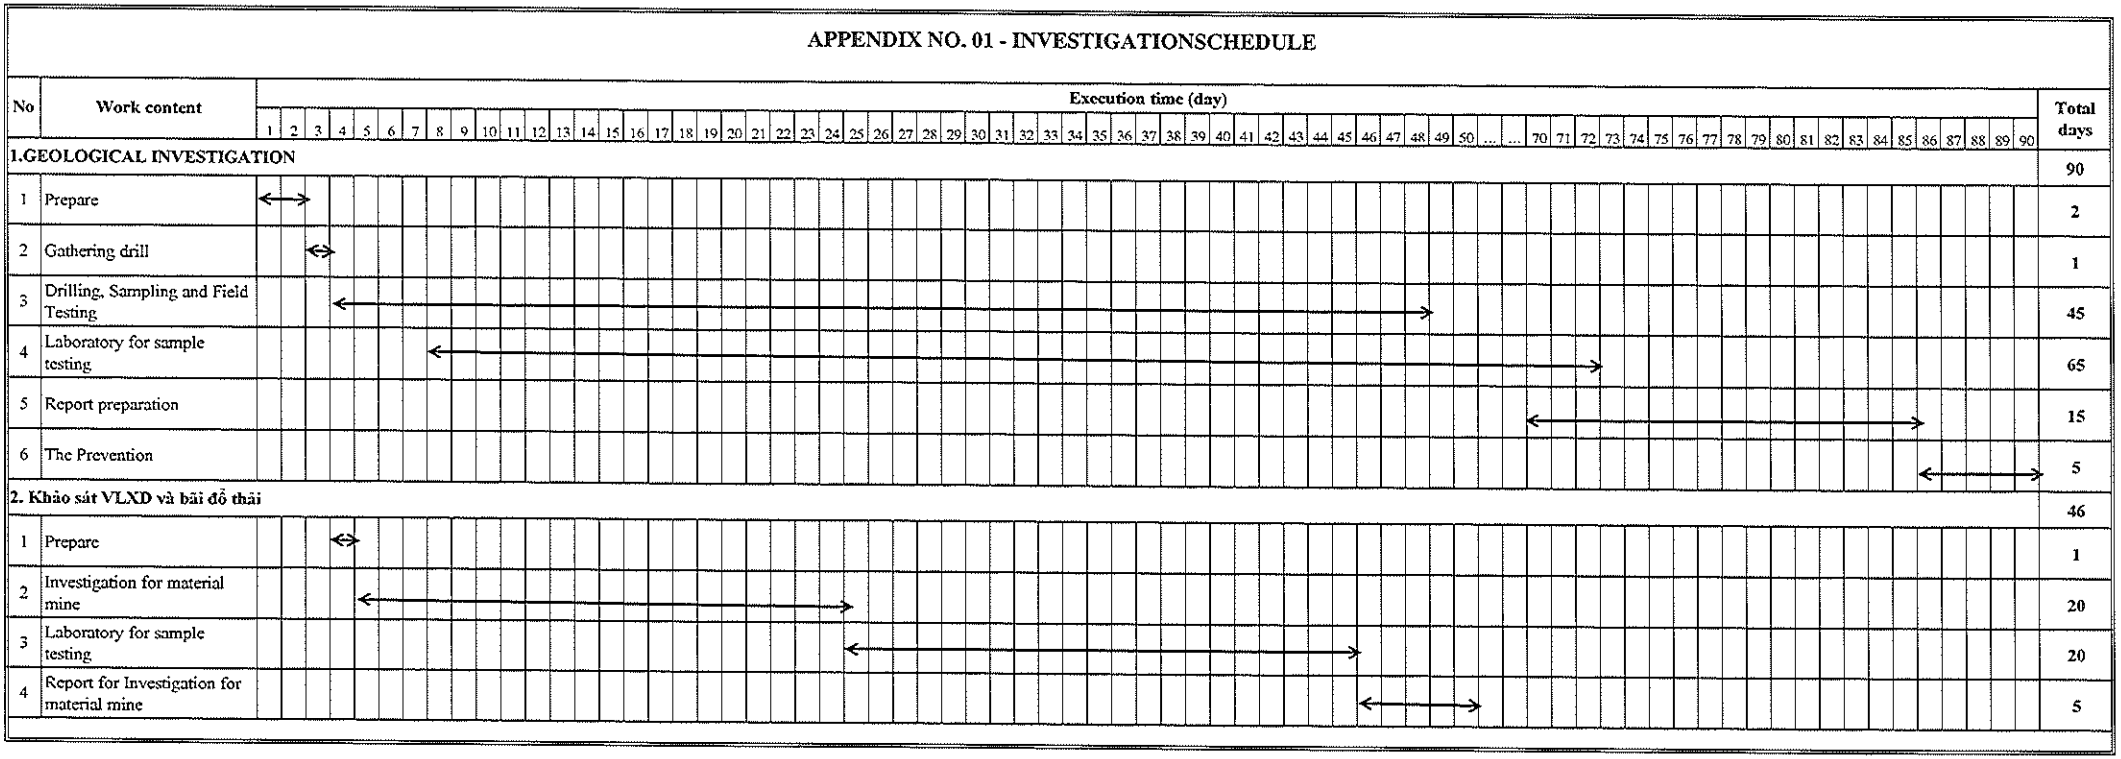
- Before construction, machinery is assembled along sidewalks, set up the fence around the machine and signboards;
- After sorting machinery stably, we can carry out thepreparation of work site:
  + The sites of drill holesurfaceare arranged 4m x 10m
  + Set up piles in order to protected corridor on both sides of the machine, positioned parallel to the roadway. Piles are designed 1.5m in length, the distance between the poles is 1.5-2m, connected with wire stakes are reflective rope. Each corridor is estimated at 10m.
  + Traffic signal lightsshould be settled at the first pile and the last pile and necessary to appoint staff to guide and manage the traffic
  + Put up warning signboards (alert direction warning signboard, narrow roadssignboard, constructionsiteboards) at two sides of the construction area. Placement of billboards should be about 5m farfrom marker fence.
  + After finishing the preparation work, it is necessary to appoint staff to guide and manage the traffic to transport the driller to the drilling position.Arranging machine floor neatly, not exceed the scope of construction. When executing, the occupied area by the driller should be about 3-4m: after finished drilling date, put machine's leg(reduced to about 1 meter), supplies and piles neatly in orderto return road for traffic participants.
- Because of location of construction includes roadway and sidewalk so construction time should be arranged throughout the day and night:
  + With line heart boreholes, because of high traffic density, conducted time should be at night from 8 pm(previous day) to 4 am (next day)
  + With side walk boreholes, there is a litle effect on the circulation of vehicles, so the conducted time should be during the day, starting from 7am to 6 pm.
- On implementing the construction works, all drilling teams must obey all the regulations on labor safety in the construction and regulations during the construction on roads where being exploited. People on the construction sitemust be fully equipped with protective clothing, shoes, hard hat as prescribed.
- After finished all the construction, original status of road should be returned.
- After construction, original status of road should be returned.
- Construction work is divided into 4 section:
  + Section 1: Km 0+00 – Km 0+910
  + Section 2: Km 0+910 – Km 1+940
  + Section 3: Km 1+940 – Km 3+200
  + Section 4: Km 3+200 – Km 5+500
- Construction time starting on 08.10.2015 until 30.10.2015



Appendix 1: Schedule on geological investigation

APPENDIX NO. 01 - INVESTIGATIONSCHEDULE

No	Work content	Execution time (day)	Total days
1.GEOLOGICAL INVESTIGATION			**90**
1	Prepare		**2**
2	Gathering drill		**1**
3	Drilling, Sampling and Field Testing		**45**
4	Laboratory for sample testing		**65**
5	Report preparation		**15**
6	The Prevention		**5**
2. Khảo sát VLXD và bãi đổ thải			**46**
1	Prepare		**1**
2	Investigation for material mine		**20**
3	Laboratory for sample testing		**20**
4	Report for Investigation for material mine		**5**



NOTE:

The drilling geotechnical investigation is expected in 90 days include the following items:

The preparation of machinery, equipment and supplies: 2 days

Transporting machinery from the warehouse to the construction gathered: 1 day

Drilling, Sampling and Field Testing: 45 day (we will supply on the working day following completion of the bore)

Experiment activity in Experiment activity in laboratory is implemented promptly after when drilling activity for the first borehole is finished. This activity is expected to start on the 4th day after the first drilling and shall last during entire drilling process. Total expected day for experiment implementation is 65 days

Report preparation (final report): 15 days

Prevention: 5 days

-Investigation for material mine is expected in 46 days include the following items:

Prepare: 1 day

Investigation for material mine: 20 days

Laboratory for sample testing 20 days

Report for Investigation for material mine: 5 days

Appendix 2: Co-ordinate of boreholes and Quantity of investigation.

IV. Content/ Nội dung

- Establishment Decision of Laboratory No. 01/QĐ-STGC date 01/03/2010 of Trading Technology Construction JCS (T&C)/ Quyết định thành lập phòng thí nghiệm số 01/QĐ-STGC ngày 01/03/2010 của Công ty CP Dịch Vụ Thương Mại Công Nghệ và Xây Dựng (T&C).

- Approving Decision of execution capaty for the soil test and testing method No.161/QD-BXD date 21/04/2010 and No. 632/QD-BXD date 27/12/2010 of Ministry of Contruction/ Quyết định công nhận năng lực thực hiện các phép thử và phương pháp thử số 161/QD-BXD ngày 21/04/2010 và số 632/QD-BXD ngày 27/12/2010 của Bộ Xây Dựng.

- Decision of Laboratory testing Chief No. 02 /QĐ-STGC date 02/04/2010 of Director of Trading Technology Construction JCS (T&C)/ Quyết định bổ nhiệm Trưởng phòng Thí nghiệm số 01/QĐ-STGC ngày 02/04/2010 của Công ty CP Dịch Vụ Thương Mại Công Nghệ và Xây Dựng (T&C).

- Testing certificate of testing personal No. 6449/2010/VKH –TNXD 35/CN –TTĐT&TT, 03/2010/TTNCĐKT-MĐC 0083/2012/HVCBQLXD&ĐT, 6426/2010/VKH-TNXD, QĐ 14/2014/TNV, QĐ 14/2014/TNV, QĐ 14/2014/TNV, QĐ 14/2014/TNV, 1496/2006/VKH-TNXD, 38/09 TT NC ĐKT- ĐHMĐC, 20/09 TT NCĐKT- ĐHMĐC, 15/09 TT NCĐKT-ĐHMĐC, 329/2003/VKH-TNXD, 6425/2010/VKH –TNXD Chứng chỉ nghề của các thí nghiệm viên số 6449/2010/VKH –TNXD 35/CN –TTĐT&TT, 03/2010/TTNCĐKT-MĐC

0083/2012/HVCBQLXD&ĐT, 6426/2010/VKH-TNXD, QĐ 14/2014/TNV, QĐ 14/2014/TNV, QĐ 14/2014/TNV, QĐ 14/2014/TNV, 1496/2006/VKH-TNXD, 38/09 TT NC ĐKT- ĐHMĐC, 20/09 TT NCĐKT- ĐHMĐC, 15/09 TT NCĐKT- ĐHMĐC, 329/2003/VKH-TNXD, 6425/2010/VKH –TNXD

- Testing equipments/ Thiết bị thí nghiệm:

Name of Equipments/ ***Tên thiết bị***	**Unit** ***Đơn vị***	**Quantity** ***Số lượng***
+ Practicle size & Hydrometer/ Bộ rây và tỷ trọng kế	Set/ bộ	3
+ Moisure content equipment/ Bộ thí nghiệm độ ẩm	Set/ bộ	L.S
+ Atterberg limits Cassagrande/ Bộ thí nghiệm chảy dẻo Cassgrande	Set/ bộ	3
+ Direct shear test/ Máy cắt phẳng	Set/ bộ	2
+ Consolidation test / Máy nén cố kết	Set/ bộ	24
+ Oedometer test/ Máy nén nhanh	Set/ bộ	24
+ Triaxial compression test (ELE)/ Máy nén 3 trục (ELE)	Set/ bộ	1
+ Unconfined compression test / Máy thí nghiệm nén nở hông	Set/ bộ	1
+ Permeability meter for clayey soil/ Bộ thí nghiệm thấm cho đất	Set/ bộ	1
+ Standard and Modified compaction test apparatus (rammer and mould)/ Bộ thí nghiệm đầm nén tiêu chuẩn	Set/ bộ	2
+ And other equipment / Một số thiết bị khác:	L.S	-

V. Conclusion/ Kết luận:

- Personnel, laboratory equipments and testing guarantee exactly to the decision and certificated/ Nhân sự, thiết bị thí nghiệm và các phương pháp thử đảm bảo đầy đủ, chính xác theo các quyết định và giấy chứng nhận kiểm định.

- Approving laboratory LAS-XD 910 for testing experiment samples for the Project/ Chấp thuận phòng thí nghiệm LAS-XD 910 thí nghiệm mẫu cho dự án.
